

Abstract

A suture anchoring device comprising (1) a first retaining member having a first surface, a second surface and a first outer edge; where the second
5 surface lies in a first plane; the first retaining member having an opening that extends from the first outer edge to at least partially through the second surface to an inner point of the first retaining member; (2) a second retaining member having a third surface, a fourth surface and a second outer edge; where the third surface lies in a second plane, the second retaining member
10 having a holding means; and (3) a coupler having a third outer edge and a cross-sectional area taken in a plane parallel to the first plane that is smaller than the cross-sectional area of the first retaining member taken in a plane parallel to the first plane; where the coupler joins the first retaining member to the second retaining member at the second surface and third surface;
15 wherein the second and third surfaces are parallel to each other and non-coterminous.
